

$^{46}\text{Ca}(\text{d},\text{p}) \quad 1966\text{Be08,1965Bj02}$

Type	Author	History	
		Citation	Literature Cutoff Date
Full Evaluation	T. W. Burrows	NDS 108, 923 (2007)	20-Feb-2007

All data are from [1966Be08](#), except as noted. Both groups measured $\sigma(\theta)$ (spectrometer,emulsion) and performed DWBA analysis.

There is good agreement between the two sets of data. See [1966Be08](#) for a discussion of the differences for states at 3296, 5311, 5459, and 5842 keV. Others: see [1977Ha45](#).

[1965Bj02](#): E=10 MeV. $\theta(\text{C.M.}) \approx 10^\circ - 180^\circ$; 24 angles.

[1966Be08](#): E=7 MeV. Overall energy resolution=12 keV. $\theta(\text{C.M.}) = 30^\circ - 150^\circ$; 24 angles.

 ^{47}Ca Levels

E(level)	J $^{\pi \dagger}$	L ‡	C $^2S' \#$	E(level)	L ‡	C $^2S' \#$
0.0		3	2.1	5254 5	&	
2017 5		1	3.9	5305 5	2,(3)	0.06,(0.40)
2580 5		2	0.08	5325 5	4	1.7

5220 5				6555 ^a 10		

† From sharp minimum in $\sigma(\theta)$ at back angles.

‡ For E(level) \leq 6.1 MeV absence of an L value indicates a non-stripping character for $\sigma(\theta)$.

$\#$ Uncertainty due to DWBA was 10 to 20% for most transitions, larger for 1f5/2 and 1d3/2.

$^@$ Results in various stripping and pickup reactions are discrepant. See comment in Adopted Levels.

$\&$ $\sigma(\theta)$ uncertain forward of 90°.

a From [1965Bj02](#).
